

World Class Pneumatic Solutions

Automatic Valve Corp

Novi, Michigan USA

Automatic Valve is here to serve your pneumatic actuation needs.

Since 1945, Automatic Valve's exclusive focus has been fluid power. Engineering and Quality are our foundations. Our systems are registered to ISO 9001:2000, certified to ANSI N45.2 and ASME. Our engineers are experienced, knowledgeable, and customer focused.

With a library of thousands of working applications, we can quickly provide you with a solution to your specialized pneumatic needs. Our network of full service distribution is available to help with on-site support, rapid deliveries and total package solutions.

Whether you are looking for a single air valve, a manifold with complicated pneumatic circuitry, or something individually dedicated to your specifications, we can help with a world class pneumatic application.

Compact Spool Valves Design Features

Valves

- Inline or manifold mount: flexible, efficient.
- Balanced spool construction allows ports to be plugged for 2 way or 3 way function, or restricted for inexpensive cylinder exhaust speed control.
- Wide variety of options and operators available.
- Specific application needs? Consult the factory. We will build it for you.

Tapered Tee-Seal Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
 - Mechanically Locked
 - No Spiral Twist
 - No Extrusion
 - Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard. (Extended Turn and Turn-Locking available)

Products Certified To:

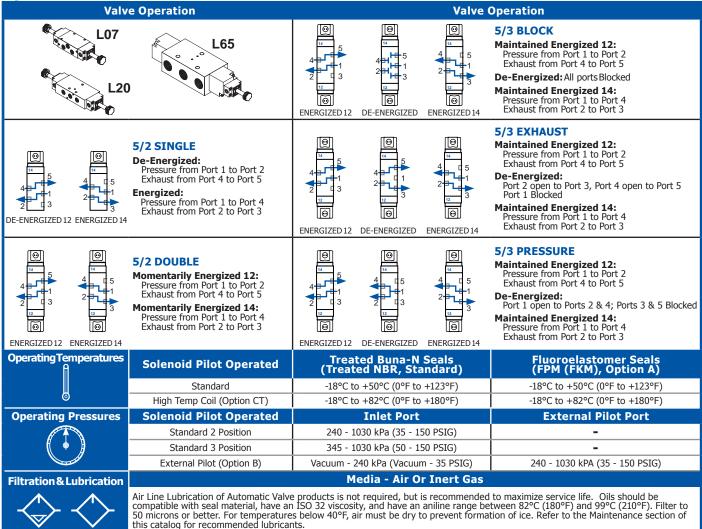

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

Compact Spool Valves Options & Accessories

Options (Add the suffix to the end of the Model Number in alpha-numeric order)

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion. Field Conversion
В	External Pilot	 Remove solenoid and cap from the valve body. Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. Refasten the gasket, cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.
СТ	Conduit Coil High Temperature	Refer to the "Electrical Information" page in this section for details.
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated.
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.
L	Low Watt Coil	Power Consumption = 2.5 Watts. Standard as Push Non-Locking Override. Also available with Option 2, Extended Turn-Locking Override.
LL	Lowest Watt Coil	Power Consumption = 0.7 Watts. Standard as Extended Turn-Locking Override.
S	303 Stainless Steel	303 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications. (L20 only)
SS	316 Stainless Steel	316 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications. (L20 only)
W	G Threads	All ports tapped to metric "G" standard (for 3/8", 3/4", 1"). Not required for 1/8" or 1/4" ports, which use a universal G/NPT tap.
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.
Z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.
1	Push Turn-Locking Override	Solenoid cap provides an override that is pushed in and turned to actuate & lock in the "on" position.
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.
4	No Override	Solenoid cap does not provide a manual override.
	•	

Accessories

Series

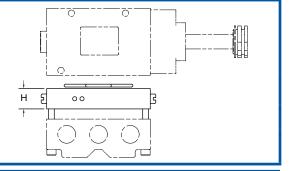

L07

L20

Interposed Flow Control

- Restricts air flow from port 2 to port 3 and from port 4 to port 5.
- Mounts between the valve and the manifold.

		24
Model Number	Dimension H	Weight Kg (lb)

B8022-005	12,7 0.50	0,09 (0.19)

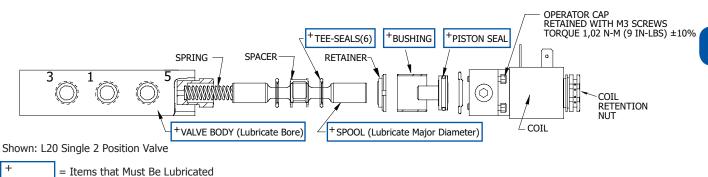

Compact Spool Valves Service Information

5/2 MM 5/3

/alve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out procedures.
- 2. Turn off electrical power to the valve.
- 3. Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- 5. Remove coil by first removing the coil retention nut.
- Remove the operator cap by first removing the 4 socket head cap screws.
- Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- 8. Clean the spool with a clean cloth.
- 9. Discard the spring (Single Spring Return models only).

- Lubricate the designated "+" items in the above assembly drawing with a thin film of lubricant - the item should look "WET" with no excess lubricant visible.
- 11. Replace components as shown above.
 - 11.1 Replace spring pad and spring (Single Spring Return models only).
 - 11.2 Alternate Tee-seals and spacers.
 - 11p.3 Once all 6 Tee-seals are installed, replace the retainer, bushing and piston.
- 12. Orientate the operator cap by aligning the open end of the gasket with the pilot hole in the valve body.
- Torque cap screws into body to 1,02 N-m (9 in-lbs) ±10%.
 Alternate tightening of the screws, so cap "squeezes" evenly onto the body.

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

3 Way Compact Spool Valves **Design Features**

Valves

- Compact size, high flow.
- Inline or manifold mount (L21 only): flexible, efficient.
- Wide variety of options and operators available.
- Lockout tested and approved to SAE specifications.
- Specific application needs? Consult the factory. We will build it for you.

В

Tapered Tee-Seal Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
 - Mechanically Locked
 - No Spiral Twist
 - No Extrusion
 - Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard. (Extended Turn and Turn-Locking available)

Products Certified To:

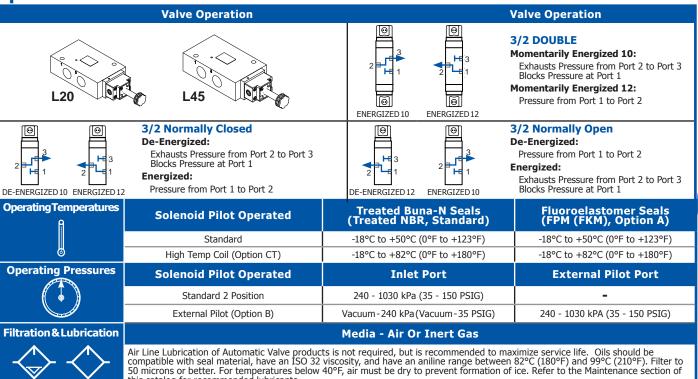

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

Hand Lever

3 Way Compact Spool Valves Manual and Lockout

Short stroke for quick response. Bright red handle for visibility. Can be Padlocked in the closed position. When handle is pulled outward, Inlet Port 1 is compared to Outlet Port 2, and Exhaust Port 3 is blocked. When handle is pushed inward, Inlet Port 1 is clocked, an Outlet Port 2 is connected to Exhaust Port.

Options (Add the Suffix to the end of the Model Number in alpha-numeric order)

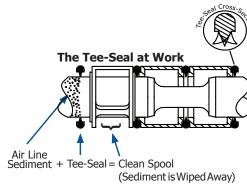

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. (Lockout Valve only) Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion.
		Field Conversion
В	External Pilot	 Remove solenoid and cap from the valve body. Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. Refasten the gasket, cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.
СТ	Conduit Coil High Temperature	Refer to the "Electrical Information" page in this section for details.
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated.
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.
L	Low Watt Coil	Power Consumption = 2.5 Watts. Standard as Push Non-Locking Override. Also available with Option 2, Extended Turn-Locking Override.
LL	Lowest Watt Coil	Power Consumption = 0.7 Watts. Standard as Extended Turn-Locking Override.
w	G Threads	All ports tapped to metric "G" standard.
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.
Z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.
1	Push Turn-Locking Override	Solenoid cap provides an override that is pushed in and turned to actuate & lock in the "on" position.
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.
4	No Override	Solenoid cap does not provide a manual override.

Top Mount Spool Valves Design Features

Valves

- Balanced spool construction allows ports to be plugged for 2 or 3 way function, or restricted for inexpensive cylinder exhaust speed control.
 - For selector or dual pressure applications, consult the Factory.
- Manifold or line mount: flexible, efficient.
- Solid manifold construction for rugged, reliable performance.
- Specific application needs? Consult the factory. We will build it for you.

Tapered Tee-Seal Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
 - Mechanically Locked
 - No Spiral Twist
 - No Extrusion
 - Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications:
 Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard. (Extended Turn and Turn-Locking available)

Products Certified To:

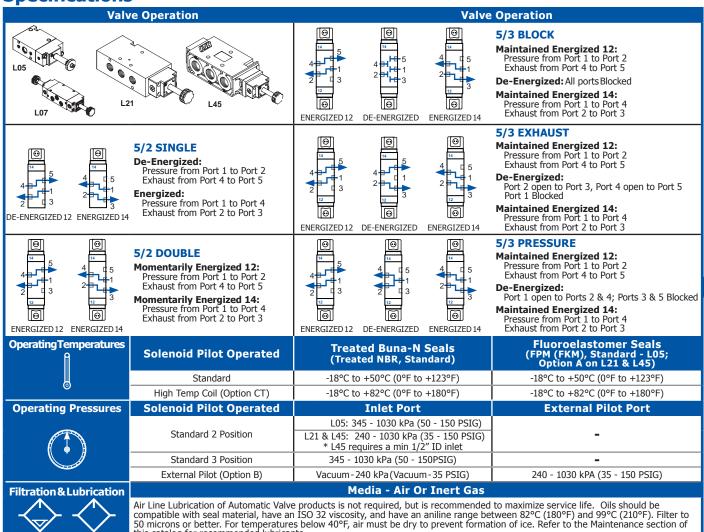

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

Top Mount Spool Valves Options

L05 Options (Add the suffix to the end of the model number in alpha-numeric order)

Suffix	Option	Description
В	External Pilot	For solenoid applications where the pressure to port one is less than 35 PSIG (2 BAR). If an externally piloted L05 is required, it must be ordered as such. Field conversion is not applicable.

L07, L21, L45 Options (Add the suffix to the end of the model number in alpha-numeric order)

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.
		For solenoid applications where the pressure to port one is less than 35 PSIG (2 BAR). See example below for field conversion of the L07, L21 and L45.
		Field Conversion for the L07, L21 & L45
		Remove solenoid and cap from the valve body. Remove solenoid and cap from EXTERNAL PILOT VALVES GASKET ROTATED 180°
В	External Pilot	Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket.
	External riot	Refasten the gasket, cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. 8 8 8 9 9 9 9 9 9 9
		Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection. VALVES REMOVE 1/8 NPTF PLUG FOR EXTERNAL PILOT PORT
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.
СТ	Conduit Coil High Temperature	With 30" Leads. Refer to the "Electrical Information" page in this section for details .
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated.
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.
L	Low Watt Coil	Power Consumption = 2.5 Watts. Standard as Push Non-Locking Override. Also available with Option 2, Extended Turn-Locking Override.
LL	Lowest Watt Coil	Power Consumption = 0.7 Watts. Standard as Extended Turn-Locking Override.
S	303 Stainless Steel	303 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications (L45 only).
SS	316 Stainless Steel	316 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications (L45 only).
W	G Threads	All ports tapped to metric "G" standard.
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.
Z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.
1	Push Turn-Locking Override	Solenoid cap provides an override that is pushed in and turned to actuate & lock in the "on" position.
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.
4	No Override	Solenoid cap does not provide a manual override.

Top Mount Spool Valves Service Information

Valve must be disconnected from all air and electrical power sources before disassembly.

Shown: L05 Single 2 Position Valve

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out procedures.
- 2. Turn off electrical power to the valve.
- 3. Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- 5. Remove coil by first removing the coil retention nut.
- Remove operator cap by first removing socket head cap screws (L05: 2 screws) (L07, L21, & L45: 4 screws).
- Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- For L05, discard spool.
 For L07, L21, or L45, clean the spool with a clean cloth.
- 9. Discard the spring (Single Spring Return models only).
- 10. Lubricate the designated "+" items in the above assembly

drawing with a thin film of lubricant - the item should look "WET" with no excess lubricant visible.

11. Replace components as shown above.

For L05:
• Replace spring and spool.

For L07, L21 & L45:

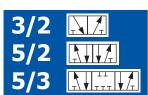

- Replace spring pad and spring (Single Spring Return models only).
- · Alternate Tee-seals and spacers.
- Once all 6 Tee-seals are installed, replace the spool, retainer, bushing and piston.
- Orientate the operator cap by aligning the open end of the gasket with the pilot hole in the valve body.
- 13. Torque cap screws into body to 1,02 N-m (9 in-lbs) $\pm 10\%$. Alternate tightening of the screws, so cap "squeezes" evenly onto the body.

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

NAMUR Actuator Solenoids Design Features

Valves

- Proven design with over 20 years OEM experience.
- Many options available to meet your requirements including:
 - Explosion proof and intrinsically safe operators
 - o Stainless Steel
 - Fluoroelastomer Seals
 - Easily converted from 4 way to 3 way operation
- Specific application needs? Consult the factory.
 We will build it for you.

Tapered Tee-Seal Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
 - Mechanically Locked
 - No Spiral Twist
 - No Extrusion
 - Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications:
 Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard. (Extended Turn and Turn-Locking available)

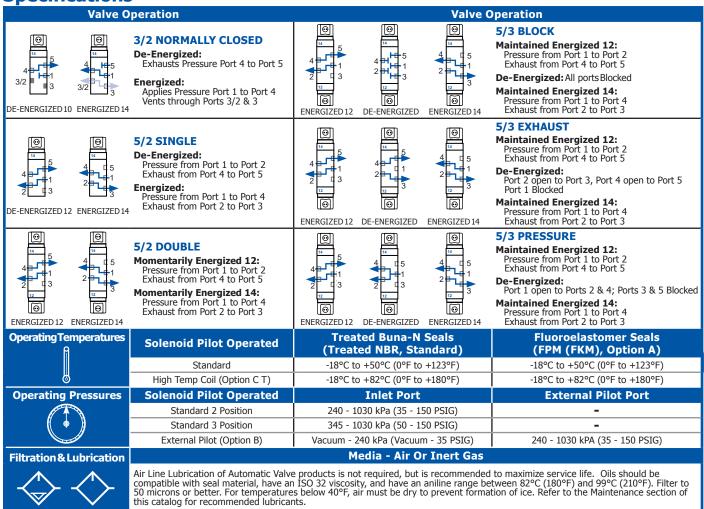

Products Certified To:

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

NAMUR Actuator Intrinsically-Safe Solenoids

Dimensional Information

Intrinsic Safety is a type of protection based on the restriction of electrical energy within an apparatus and of interconnecting wiring exposed to the potentially explosive atmosphere to a level below that which can cause ignition by either sparking or heating effects.

Basic Circuit and Application:

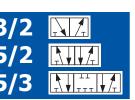

*Automatic Valve Corp does not sell the safety barrier that is required for an intrinsically safe circuit.

NAMUR Actuator Solenoids Options

Options (Add the suffix to the end of the model number in alpha-numeric order.)

Suffix	Option	Description					
		For applications where fluid media or ambient conditions are not compatible with nitrile seals. (D20 only)					
A	Fluoroelastomer Seals	Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.					
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion. (D20 only)					
		Field Conversion					
		Remove solenoid and cap from the valve body.					
В	External Pilot	Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. INTERNAL PILOT HOLE PILOT VALVES PILOT VALV					
		Refasten the gasket, cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. Remove the 1/8 NPTE pipe plug.					
		from the cap and make the external pilot connection. REMOVE 1/8 NPTF PIPE PLUG FOR EXTERNAL PILOT PORT					
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.					
СТ	Conduit Coil High Temperature	Refer to the "Electrical Information" page in this section for details.					
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated. (D20 only)					
G	Coil With 18" Leads	efer to the "Electrical Information" page in this section for details.					
L	Low Watt Coil	Power Consumption = 2.5 Watts. Standard as Push Non-Locking Override. Also available with Option 2, Extended Turn-Locking Override.					
LL	Lowest Watt Coil	Power Consumption = 0.7 Watts. Standard as Extended Turn-Locking Override.					
P	Transition Plate	For mounting to surface pads smaller than 6,4 cm x 3,5 cm (2 1/2" x 1 3/8"). Refer to next page for Installation Instructions. (D20 only)					
Q	Closed Loop	Exhaust feedback in closed loop position. (D20 only)					
S	303 Stainless Steel	303 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications (D20 Bar Stock only).					
SS	316 Stainless Steel	316 Stainless Steel body, all other external parts are corrosion resistant; for corrosive environment applications (D20 Bar Stock only).					
W	G Threads	All ports tapped to metric "G" standard.					
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.					
Z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.					
1	Push Turn-Locking Override	Solenoid cap provides an override that is pushed in and turned to actuate & lock in the "on" position.					
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.					
4	No Override	Solenoid cap does not provide a manual override.					
8	10-24 Mounting Kit	Mounting kit contains #10-24 mounting screws and set screw					
9	10-32 Mounting Kit	Mounting kit contains #10-32 mounting screws and set screw					

NAMUR Actuator Solenoids **Options & Accessories**

Option P: Transition Plate

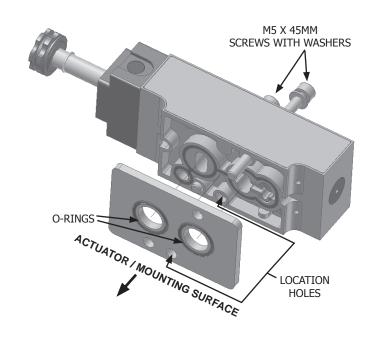

The Transition Plate is designed for use in situations where the sealing face of the solenoid valve extends beyond the mounting surface.

(The minimum required mounting area measures 6,4 cm x 3,5 cm (2 1/2" x 1 3/8"))

Part Number

Option P: when ordering the plate with a valve

A8021-339: when ordering the plate only

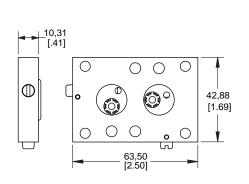

Installation Instructions: Transition Plate

- 1. Place the plate between the solenoid valve and the actuator with the o-rings facing the actuator.
- 2. Use the supplied **M5 x 45mm screws** to secure the solenoid valve/plate assembly to the mounting surface. These are the screws supplied in the plate kit, not those originally supplied with the valve. Do NOT use the shorter 40mm original screws; they will not engage properly.
- Torque screws to 4,4-5,3 N-m (39-47 in-lbs) $\pm 10\%$ to effect a seal on the o-ring and gasket side of the transition plate.

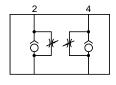

Speed Control Valve

- For Bar Stock Models Only
- Mounts between the Directional Control Valve and the Actuator
- Mounts on the NAMUR pad
- Functions as a flow control for both cylinder ports
- Is easily adjustable, turn the needles clockwise to decrease speed and counterclockwise to increase speed
- Normal operating pressure: 2 to 10 BAR (35 to 150 PSIG)
- Normal operating temperature: -18°C to +52°C (0°F to +125°F)
- Approximate weight: 0,07 kg (0.16 lb)

COMPACT MODULE WITH KEYSTONE AND NAMUR MOUNTING **SCREWS** #10-32 x 1.75 O-RING SEAL FOR AIR PASSAGES LONG TAPER NEEDLE FOR CLOSE CONTROL

Model Number A7106-554

Part Number

		Mufflers					
Part Number	Description		Pipe Size NPT	Flow I/min (C _V)	Length mm (in)	Hex Size mm (in)	Weight kg (lb)
84C-2	Exhaust Muffler Reduces exhaust noise level in air systems. Maintains full volume air flow with minimum back pressure. Threads into exhaust port.		1/4	2060 (2.3)	44,5 (1.75)	14,3 (9/16)	0,020 (0.044)
84D-2	Sintered Exhaust Muffler Reduces exhaust noise level in air systems. Sintered bronze bonded to a copper plated male pipe fitting. Corrosion resistant. Cleanable 40 micron filter element.		1/4	600 (0.7)	33,3 (1.31)	14,3 (9/16)	0,017 (0.037)
266B-2	 Exhaust Restricter/Sintered Muffler Reduces exhaust noise level in air systems. Allows adjustment of exhaust air flow to accurately control cylinder speeds. Corrosion resistant. Cleanable 40 micron filter element. 		1/4	1160 (1.3)	55,9 (2.2)	14,3 (11/16)	0,026 (0.057)

90° Mounting Plate

- For Bar Stock Models Only
- Allows horizontal installation of the directional control valve.
- Orientates the valve 90° to the actuator.

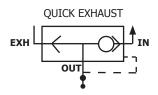

D

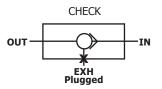

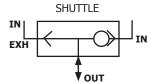

NAMUR Actuator Solenoids Accessories

Quick Exhaust, Check and Shuttle Valves: Series: MQ2

One model does all three functions

Features

- Rugged internal construction outlasts and out performs the competition.
- Quick Exhaust: When IN is pressurized, flow is from IN to OUT with EXH blocked. When OUT is pressurized, flow is from OUT to EXH with IN blocked
- Check Valve: Free flow from IN to OUT with EXH plugged. No flow from OUT to IN with EXH plugged.
- Shuttle Valve: When IN is pressurized, flow is from IN to OUT with EXH blocked. When EXH is pressurized, flow is from EXH to OUT with IN blocked.

NAMUR Actuator Solenoids Service Information

Valve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

- D
- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out procedures.
- 2. Turn off electrical power to the valve.
- 3. Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- 5. Remove coil by first removing coil retention nut.
- Remove operator cap by first removing 4 socket head cap screws.
- 7. Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- 8. Clean the spool with a clean cloth.
- 9. Discard the spring (Single Spring Return Models Only).

- Lubricate the designated "+" items in the above assembly drawing with a thin film of lubricant - the item should look "WET" with no excess lubricant visible.
- 11. Replace components as shown above.
 - 11.1 Replace spring pad and spring (Single Spring Return Models Only).
 - 11.2 Alternate Tee-seals and spacers.
 - 11.3 Once all 6 Tee-seals are installed, replace the retainer, bushing and piston.
- Orientate the operator cap by aligning the open end of the gasket with the pilot hole in the valve body.
- Torque cap screws into body to 1,02 N-m (9 in-lbs) ±10%.
 Rotate tightening so that cap "squeezes" evenly onto body.

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

Model Numbers: Service Kits

Series		В	ody Style
Sei les	Description	Model Number	Contents
	Single	K-L20-SGL K-L20-SGL-A (Fluoroelastomer)	Tee-Seals (6), Piston Seal (1), Spring (1), Lubricant
D20	Double	K-L20-DBL K-L20-DBL-A (Fluoroelastomer)	Tee-Seals (6), Piston Seals (2), Lubricant
D20	Standard Mounting Kit	A8021-340	Plug Assembly (1), Gasket (1), Screws (2), Set Screw (1), Washers (2), Lubricant

NAMUR Actuator Solenoids 4Way/3Way Conversion

Views

4 Way

The D20 works as a 4 way when the plug is in the outer cavity.

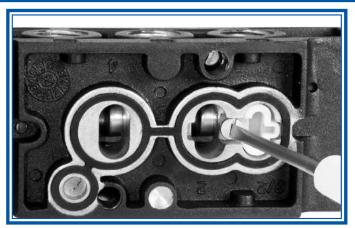

3 Way

The D20 works as a 3 way when the plug is in the center cavity.

Conversion Steps

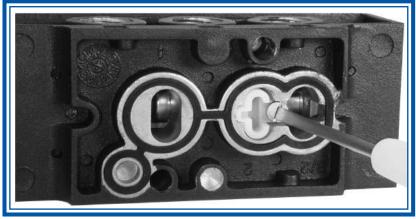

4 Way to 3 Way Conversion

STEP 1: Using a 3 mm screwdriver loosen the plug retention screw.

STEP 2: Remove the plug. Lightly lubricate the plug and O-ring. Place plug in adjacent cavity.

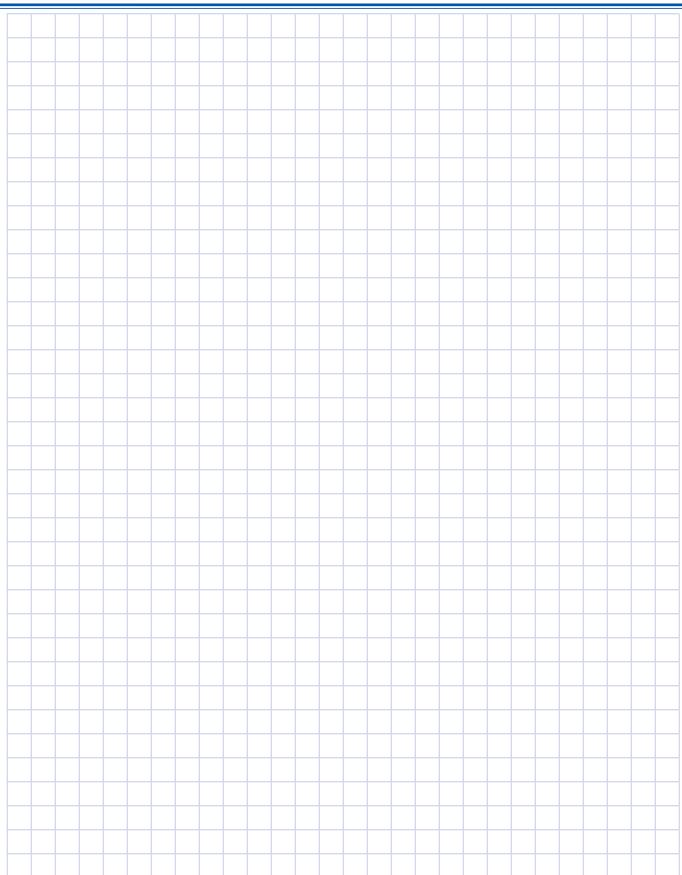

STEP 3: Tighten the plug retention screw to 0,68 N-m (6 in-lbs) $\pm 10\%$.

Series	Model Number	Contents
D20	A7216-081	Plug Assemblies (Qty 10) (screws/seals/plugs)

NAMUR Actuator Solenoids **Notes**

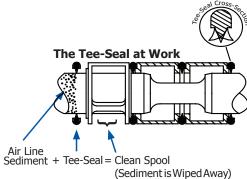

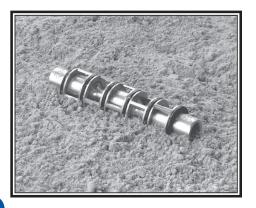

ISO Spool Valves Design Features

Valves

- Wide variety of options and operators available.
- Conforms to ISO 5599/1 specifications for size 1, 2 and 3.
- Specific application needs? Consult the factory.
 We can build it for you.

Tapered Tee-Seal...... Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
 - Mechanically Locked
 - No Spiral Twist
 - No Extrusion
 - Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications:
 Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Turn-Locking Override is standard.
 (Extended Push Non-Locking is available)

Products Certified To:

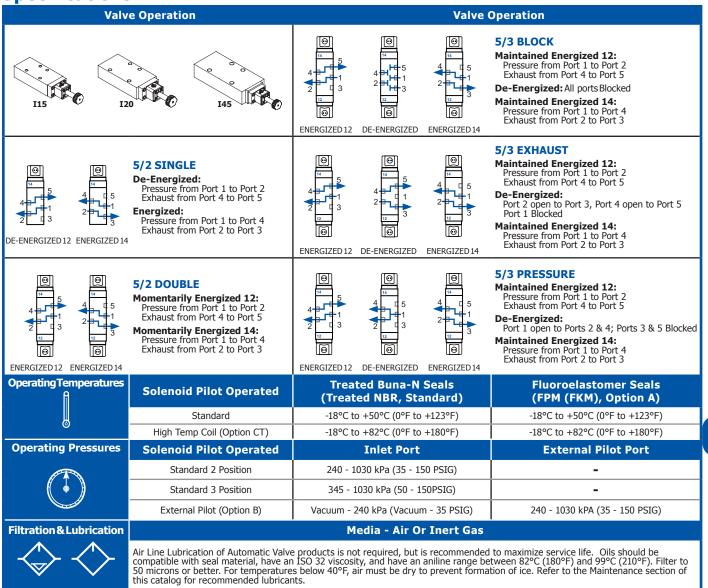

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

ISO Spool Valves

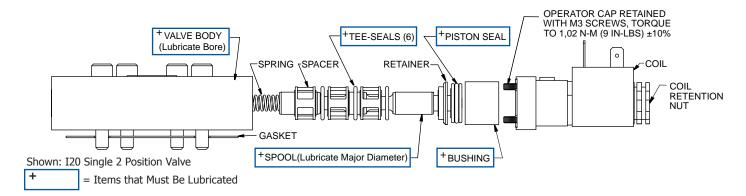

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion.
		Field Conversion
В	External Pilot	 Remove solenoid and cap from the valve body. Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. Refasten the gasket, cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection.
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.
СТ	Conduit Coil High Temperature	With 30" Leads. Refer to the "Electrical Information" page in this section for details.
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated.
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.
LL2	Lowest Watt Coil with Extended Turn-Locking Override	Power Consumption = 0.7 Watts. Solenoid cap provides an extended override that is turned to lock in the "on" position.
w	G Threads	All ports tapped to metric "G" standard. (Sub-bases and manifolds only)
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.
z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.
5	Extended Push Non- Locking Override	Solenoid cap provides an extended override that is pushed in to actuate and does not lock in the "on" position.

ISO Spool Valves Service Information

Valve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out procedures.
- 2. Turn off electrical power to the valve.
- 3. Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- Remove coil by first removing coil retention nut.
- 6. Remove operator cap by first removing 4 socket head cap screws.
- 7. Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- 8. Clean the spool with a clean cloth.
- 9. Discard the spring (Single Spring Return models only).
- 10. Lubricate the designated +*" items in the above assembly drawing with a thin film of lubricant the item should look "WET" with no excess lubricant visible.
- 11. Replace components as shown above.
 - 11.1 Replace spring pad and spring (Single Spring Return models only).
 - 11.2 Alternate Tee-seals and spacers.
 - 11.3 Once all 6 Tee-seals are installed, replace the retainer, bushing and piston.
- 12. Orientate the operator cap by aligning the open end of the gasket with the pilot hole in the valve body.
- 13. Torque cap screws into body to 1,02 N-m (9 in-lbs) $\pm 10\%$. Alternate tightening of the screws, so cap "squeezes" evenly onto the body.

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

SAE Spool Valves Design Features

Valves

- Conforms to SAE J2051 specifications for series 125, 250 and 1000.
- Flow Range of 2 to 20 Cv.
- Complete range of bases and operators available.
- Do you have specific application needs?
 Consult the factory. We will build it for you.

Tapered Tee-Seal...... Eats Dirt

- Bidirectional tapered Tee-Seal eliminates sticking problems.
 - Flexes to clean spool
- Mechanically Locked
- No Spiral Twist
- No Extrusion
- Air Line Sediment is Wiped Away.
- Tested tough and proven reliable according to SAE specifications: Rust and water injected every 864,000 cycles for 20 million cycles.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard.

Products Certified To:

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

SAE Spool Valves Specs & Model Numbers

Specifications

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 viscosity, and have an aniline range between 82°C (180°F) and 99°C (210°F). Filter to 50 microns or better. For temperatures below 40°F, air must be dry to prevent formation of ice. Refer to the Maintenance section of this catalog for recommended lubricants.

SAE Spool Valves Options & Accessories

Options (Add the suffix to the end of the Model Number in alpha-numeric order)

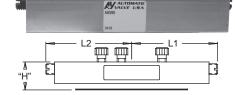

Suffix	Option	Description								
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory. (Available for A04 and A06 Only)								
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion. Field Conversion -1/16 NPTF External Pilot supply Port Plugged for standard internal pilot supply Open for external pilot supply - Option B -1/16 NPTF Internal Pilot supply - Option B -1/16 NPTF Internal Pilot supply - Option B Open for standard internal pilot supply - Option B Open for standard internal pilot supply External Pilot Supply								
В	External Pilot	 Remove the 1/16 NPTF pipe plug from the external pilot supply port in the valve and install it in the supply port. Connect the air supply to the external pilot supply port in the base. 								
D	Dustproof	For applications in extremely dusty and contaminated environments. Vent ports are plugged and spring pad breather vent is eliminated.								
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.

7	Ford - 4 Pin Micro DC									

Accessories

Interposed Flow Control

- Restricts air flow from Port A to Port EA and from Port B to Port EB.
- Mounts between the valve and the sub-base or between the valve and the single pressure regulator.
- · Vibration-proof metering control
- Interposed Flow Controls cannot be used with Interposed Dual Pressure Regulators.

AV Series	Model Number	Weight	Dimensions					
(SAE)	Model Nullibel	Kg (lb)	Н	L1	L2

SAE Spool Valves Accessories

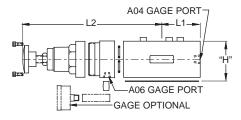

Sandwich Single Pressure Regulator

Features

- Regulates single inlet pressure from Inlet Port P to Cylinder Ports A & B.
- Mounts between the valve and sub-base.
- Two Pressure Ranges: 0,6-4,1 BAR (5-60 PSIG); and 0,7-9,0 BAR (10-130 PSIG).
- 1/8 NPTF gage port.
- On series A04, color coded locking rings identify the pressure range: Yellow 5-60PSIG; Red 10-130PSIG.
- In series A06 the fingertip control knob and locking nut are standard.
- If pressure is less then 2 BAR (35 PSIG), then valve must be externally piloted [3,4 BAR (50 PSIG) for 3 position valves].

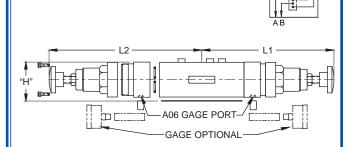

AV Series	Toma	Model I	Number	Weight	Dimensions (top-mm; bottom-inches)

Sandwich Dual Pressure Regulator

Features

- Regulates dual inlet pressure from EA EB to cylinder ports A & B.
- Mounts between the valve and sub-base.
- Two Pressure Ranges: 0,3-4,1 BAR (5-60 PSIG); and 0,7-9,0 BAR (10-130 PSIG).
- 1/8 NPTF gage port.
- On series A04, color coded locking rings identify the pressure range: Yellow 5-60; Red 10-130 PSIG.
- In series A06 the fingertip control knob and locking nut are standard.
- Dual Pressure Regulators require a valve external pilot supply and cannot be used with sandwich flow controls.

Assembly: Valve to Manifold Base

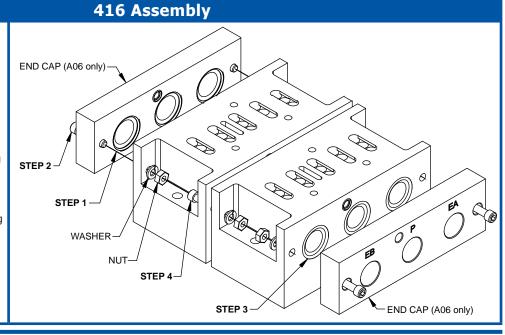

Instructions:

- 1. STEP 1: Place O-Rings in counterbores in base.
- 2. STEP 2: Assemble base to base using screws, washers, and nuts.

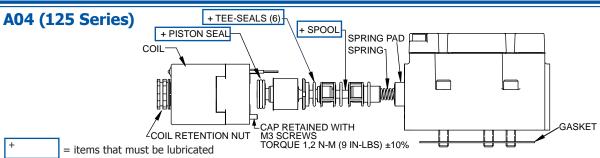

Instructions:

- 1. STEP 1: Place O-Rings in counterbores of end caps.
- 2. STEP 2 : Assemble cap to base using screws, washers, and nuts.
- 3. STEP 3: Place O-Rings in counterbores of base.
- 4. STEP 4: Assemble base to base using screws, washers, and nuts.

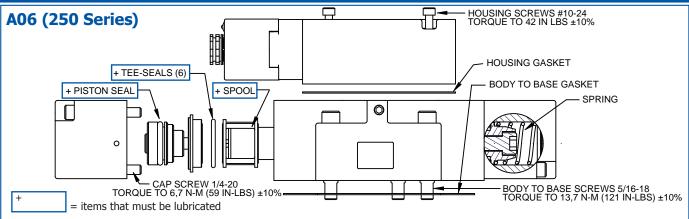

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out
- Turn off electrical power to the valve.
- Remove valve from all electrical and air power sources.
- Ensure all stored air power is exhausted.
- Remove coil by first removing coil pretention nut.
- Remove operator cap by first removing 4 socket head cap
- Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- Clean the spool with a clean cloth.
- Discard the spring (Single Spring Return models only).
- 10. Lubricate the designated "+" items in above assembly drawing

- with a thin film of lubricant the item should look "WET" with no excess lubricant visible.
- 11. Replace components as shown above.
 - 11.1 Replace spring pad (where required) & spring (Single Spring Return Models Only).
 - 11.2 Alternate Tee-seals and spacers.
 - 11.3 Once all 6 Tee-seals are installed, replace the retainer, bushing & piston, and spool.
- 12. Orientate the operator cap by aligning the open end of the gasket with the pilot hole in the valve body. (For external pilot, this hole is covered; see Field Conversion on Options Page.)
- Torque cap screws into body to 1,02 N-m (9 in-lbs) $\pm 10\%$. Alternate tightening of the screws, so cap "squeezes" evenly onto body.

Valve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

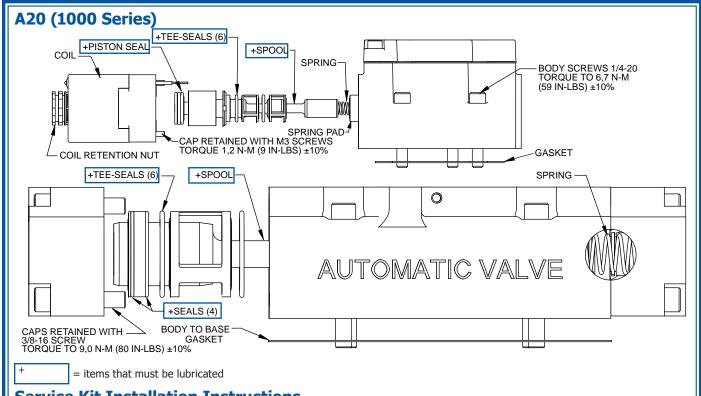

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out
- Turn off electrical power to the valve.
- Remove valve from all electrical and air power sources.
- Ensure all stored air power is exhausted.
- Remove end caps by first removing 2 socket head cap screws.
- Remove existing serviceable components by "pushing" internal components gently out of the valve body.
- Clean the spool with a clean cloth.
- Discard the spring (Single Spring Return Models Only). Lubricate the designated "+" items in the above assembly drawing with a thin film of lubricant the item should look "WET" with no excess lubricant visible.
- 10. Replace components as shown above. 10.1 Alternate Tee-seals and spacers.

- 10.2 Once all 6 Tee-seals are installed, insert the retainer and piston into end cap. Insert O-ring in end cap.
- 10.3 Replace spring (Single Spring Return models only).
- 11. Orientate spool as shown above.
- 12. Make sure rubber plug is still present in body. (9A Oper. Only)
- 13. Orientate the caps by aligning the pilot hole in the valve body with the pilot hole in the cap. (For external pilot, this hole is covered; see Field Conversion on Options Page in this Section.)
- 14. Torque cap screws into body to 6,7 N-m (59 in-lbs) ±10%. Alternate tightening of the screws, so that cap "squeezes" evenly onto body.
- 15. Replace the housing gasket, if necessary. Torque housing screws to 4,8 N-m (42 in-lbs) ±10%. Take care not to scratch interface surface.
- 16. Replace the body-to-base gasket, if necessary. Torque bodybase screws to 13,7 N-m (121 in-lbs) ±10%.

5/2 **......** 5/3 **......**

Valve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/tag-out procedures.
- 2. Turn off electrical power to the valve.
- Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- Remove plate (for air pilot) or operating valve (A04 for solenoid valves).
- For solenoid valves follow the Service Kit Installation Instructions for the A04 (see previous page).
- To service the A20 valve body follow the Service Kit Installation Instructions for the A06 (see previous page), except on Step 14, torque cap screws to 9,0 N-m (80 in-lbs) ±10%.
 Replace the gasket between the A20 and the plate or A04
- Replace the gasket between the A20 and the plate or A04 operating valve, if necessary. Do not scratch the interface surfaces.
- Orientate the plate or A04 operating valve to the A20 body by aligning air pilot holes.
- Torque cap screws into body to 6,7 N-m (59 in-lbs) ±10%.
 Alternate tightening of so that cap "squeezes" evenly onto body.

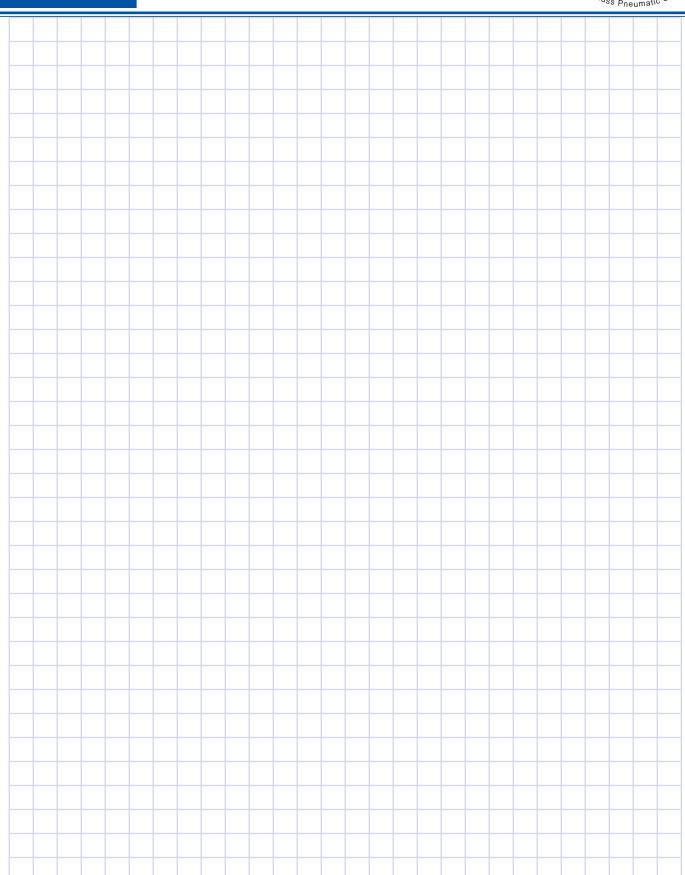

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

SAE Spool Valves Notes

F30

Direct Operated Solenoid Valves Design Features

K0302JABR

Direct Solenoid Valves

- Direct acting solenoid valves for compact, low profile and high performance.
- 2 way or 3 way function.
- Push Turn-Locking Override is standard
- Many options are available to meet your specific requirements: materials, flows, environmental ratings, manifolding. Please consult the factory.
- Specific application needs? Consult the factory. We will build it for you.

K08: 260A-2G

Manual Valves

- Long life poppet construction.
- Corrosion resistant internals.
- Body design simplifies mounting and piping.
- Optional ring guard available to protect against accidental valve actuation.

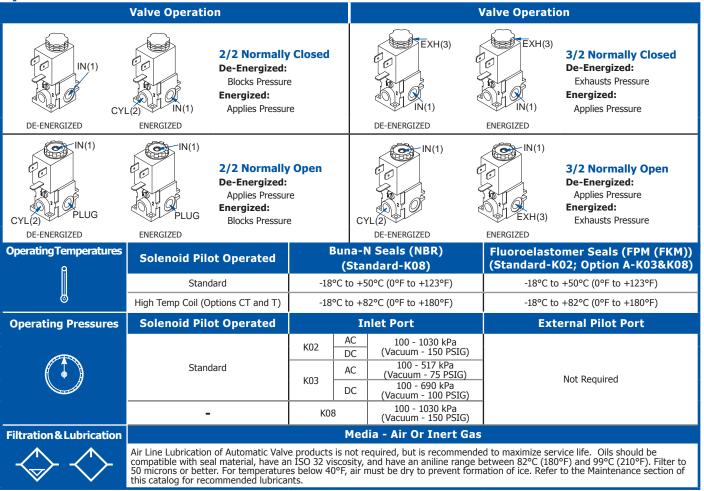

Products Certified To:

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

Direct Operated Solenoid Valve Standard Solenoid & Manifold

K02 Manifold (Standard 1/8" only)

Manifold Model Number

A K02 manifold consists of individual K02 valves. Each Station mounts to the adjacent Station using a single screw and o-ring (included with each individual K02 valve).

See chart below for K02 model numbers.

Direct Operated Solenoid Valve Options

2/2 **11.** 3/2 **11.**

KO2 Options (Add the suffix to the end of the model number in alpha-numeric order)

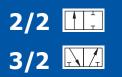

Suffix	Option	Description						
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.						
СТ	Conduit Coil High Temperature	Refer to the "Electrical Information" page in this section for details.						
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.						
0	Exhaust Nut	Open-top retainer nut for access to solenoid stem (K02 Only).						
S	303 Stainless Steel	303 Stainless Steel body, all other external parts corrosion resistant; for corrosive environment applications. (K02 Bar Stock Only)						
SS	316 Stainless Steel	316 Stainless Steel body, all other external parts corrosion resistant; for corrosive environment applications. (K02 Bar Stock Only)						
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.						
z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.						
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.						
4	No Override	Solenoid cap does not provide a manual override.						

K03 Options (Add the suffix to the end of the model number in alpha-numeric order)

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.
т	High Temperature Coil	Refer to the "Electrical Information" page in this section for details.

K08 Options (Add the suffix to the end of the model number in alpha-numeric order)

Suffix	Option	Description
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.

2/2 Direct Operated Solenoid Valve **Notes**

Direct Inline Poppet Valves Design Features

Valves

- Reliable: used world-wide in power plant applications.
- High flow design with a short stroke for fast response.
- Front or rear mounting.
- Flow from 3 to 34 Cv.
- Specific application needs? Consult the factory. We will build it for you.

Tapered Cush-N-Seal

- Molded from superior, tough, Carboxylated Nitrile. Provides five times the abrasion resistance and service life of standard Buna-N (NBR) seals.
- Cushion design increases life.
- Self-cleaning, cushioned poppet allows for quieter operation.

Solenoid ... Guaranteed Against Burnout

- Three-way pilot uses full air line pressure to shift the valve.
- Pilot is internally supplied when the pressure at port one is 35 to 150 PSIG (240 to 1030 kPa).
- Coil is hermetically sealed as an integral watertight molded unit.
- Intrinsically-safe and explosion-proof versions available.
- Push Non-Locking Override is standard.
 (Extended Turn and Turn-Locking available.)

Products Certified To:

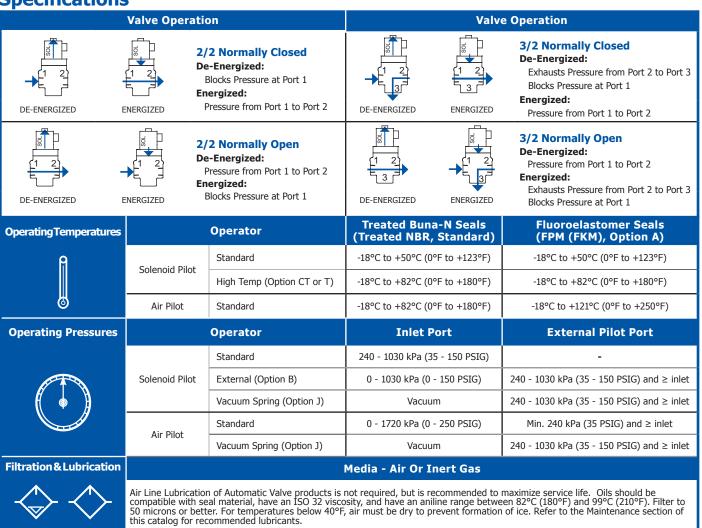

- CSA (C22.2 and UL STD 429)
- Factory Mutual Explosion Proof Environments
- ATEX Explosion Proof Environments
- CE EMF and Low Voltage Directives

Pilot Inline Poppet Valves Options

3/2 III

Options (Add the suffix to the end of the model number in alpha-numeric order)

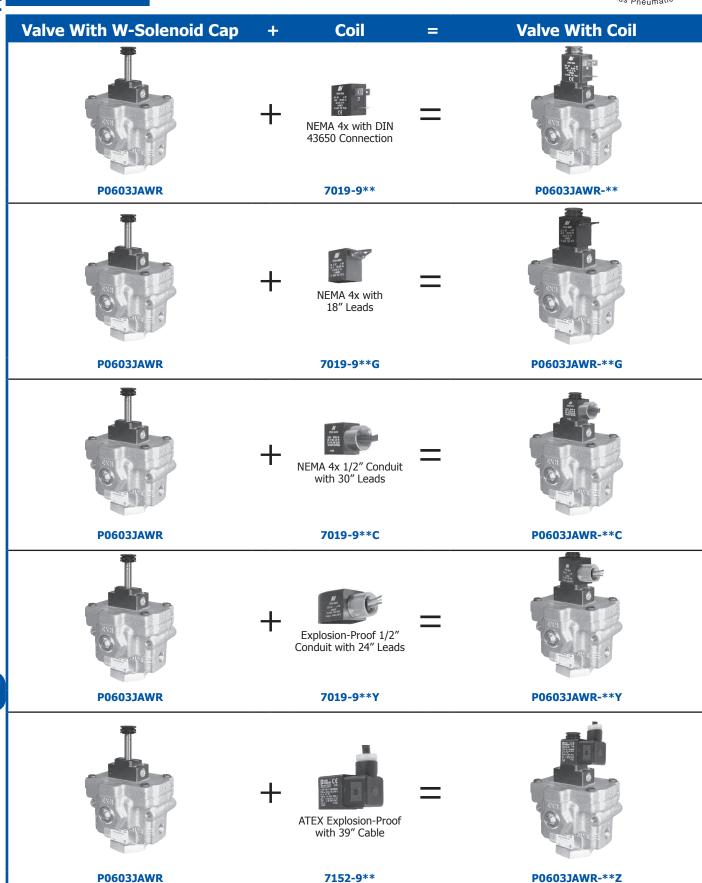

Suffix	Option	Description							
A	Fluoroelastomer Seals	For applications where fluid media or ambient conditions are not compatible with nitrile seals. Note: Fluorocarbon seals do not increase the effective temperature range of the valve. For high temperature applications, consult the factory.							
		For solenoid applications where the pressure to port one is less than 2 BAR (35 PSIG). See example below for field conversion.							
		Field Conversion for P06 & P14 Valves (W Solenoids)							
В	External Pilot	 Remove solenoid and cap from the valve body. Remove gasket from bottom of W cap. Rotate the gasket 180° so that the internal pilot hole in the valve body is covered by the gasket. Reposition on bottom of cap. Refasten the W cap and solenoid to the valve body. Make sure the gasket completely covers the internal pilot hole before tightening the M3 screws. Torque to 1,02 N-m (9 in-lbs) ±10%. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection. 							
		Field Conversion for P36 Valves (B & D Solenoids)							
		 Remove solenoid and cap from the valve body. Remove the pipe plug that is stored in the top surface of the body and place it in the tapped hole in the bottom surface cap. Refasten cap and solenoid to the valve body. Torque to 6,2 N-m (55 in-lbs) ±10%. Remove the 1/8 NPTF pipe plug from the cap and make the external pilot connection. PLACE 0957-006 PIPE PLUG STORED IN BODY TOP SURFACE AND PLUG TAPPED HOLE IN BOTTOM SURFACE OF CAP							
С	Conduit Coil	Refer to the "Electrical Information" page in this section for details.							
СТ	Conduit Coil High Temperature	Refer to the "Electrical Information" page in this section for details.							
G	Coil With 18" Leads	Refer to the "Electrical Information" page in this section for details.							
J	Vacuum Spring	Provides additional reset force when pressure at Port 1 is less then 0 PSIG (0kPa). For solenoid pilot valves, also specify option "B".							
L	Low Watt Coil	Power Consumption = 2.5 Watts. Standard as Push Non-Locking Override. Also available with Option 2, Extended Turn-Locking Override.							
LL	Lowest Watt Coil	Power Consumption = 0.7 Watts. Standard as Extended Turn-Locking Override.							
T	High Tempurature Coil	Refer to the "Electrical Information" page in this section for details. (P36 Only)							
Y	Explosion-Proof Coil (CSA, FM)	Refer to the "Electrical Information" page in this section for details.							
Z	Explosion-Proof Coil (Atex, PTB)	Refer to the "Electrical Information" page in this section for details.							
1	Push Turn-Locking Override	Solenoid cap provides an override that is pushed in and turned to actuate & lock in the "on" position.							
2	Extended Turn-Locking Override	Solenoid cap provides an extended override that is turned to lock in the "on" position.

Pilot Inline Poppet Valves Service Information

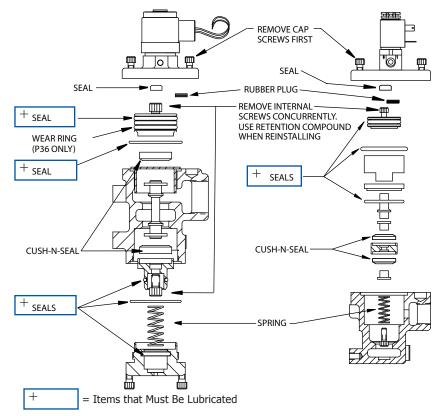

alve must be disconnected from all air and electrical power sources before disassembly.

Service Kit Installation Instructions

- Follow appropriate lock-out/tag-out procedures. Do not attempt to service a valve, if you are not familiar with lock-out/ tag-out procedures.
- 2. Turn off electrical power to the valve.
- 3. Remove valve from all electrical and air power sources.
- 4. Ensure all stored air power is exhausted.
- 5. Remove operator cap by removing 4 socket head cap screws from the operator cap.
- Remove internal screws concurrently, then remove existing serviceable components by "pushing" internal components gently out of the valve body.
- Lubricate the designated "+" items in the assembly drawing at the right with a thin film of lubricant - the item should look "WET" with no excess lubricant visible.
- 8. Replace components as shown.
 - Use retention compound on each screw when reinstalling.
- 9. Orientate the operator cap by aligning pilot hole in body with pilot hole in cap.
- Torque cap screws into body to 6,7 N-m (59 in-lbs) ±10%. Alternate tightening of screws, so cap "squeezes" evenly onto the body.

Normally Open Normally Closed

Air Line Lubrication of Automatic Valve products is not required, but is recommended to maximize service life. Oils should be compatible with seal material, have an ISO 32 or lighter viscosity, and have an aniline point between 82°C (180°F) and 99°C (210°F). Refer to the Maintenance Section of this catalog for recommended lubricants.

Accessories In-Line Mounted

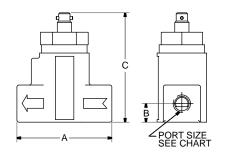

Flow Control Valves

- Allows free flow of air in one direction and adjustable flow in the opposite
- Piped between valve and cylinder.
- High flow, accurate adjustment. Tamper proof locking screw standard.
- Self-cleansing poppet eliminates sediment accumulation.

Check Valves

- Allows low cracking pressure and full area free flow of air in one direction and instantaneous shut-off in the reverse direction.
- Self-cleansing poppet eliminates sediment accumulation.

Accessories Quick Exhaust, Check & Shuttle

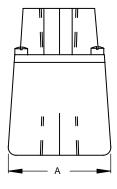

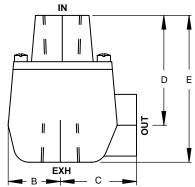

Features

- Rugged internal construction outlasts and out performs the competition.
- Quick Exhaust: When IN is pressurized, flow is from IN to OUT with EXH blocked. When OUT is pressurized, flow is from OUT to EXH with IN blocked
- Check Valve: Free flow from IN to OUT with EXH plugged. No flow from OUT to IN with EXH plugged.
- Shuttle Valve: When IN is pressurized, flow is from IN to OUT with EXH blocked. When EXH is pressurized, flow is from EXH to OUT with IN blocked.

Accessories Lockout Valves

Soft Start Option

 To order a Lockout Valve with Soft Start, add -SS to the end of the model number.

Features

- 3 way, 2 position valve.
- Short stroke for quick response.
- Padlockable in the closed position.
- · Bright red handle for visibility.
- When handle is pulled outward, Inlet Port 1 is connected to Outlet Port 2 and Exhaust Port 3 is blocked.
- When handle is pushed inward, Inlet Port 1 is blocked and Outlet Port 2 is connected to Exhaust Port 3.
- These products are defined as energy isolation devices, NOT AN EMERGENCY STOP DEVICE.

Port 2 (Outlet) Port 3 (Exhaust) Port 3 (Exhaust)

Accessories Pneumatic

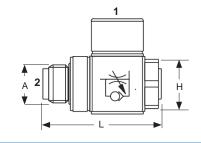

Features

- Media: Compressed air or inert gas, lubricated or non-lubricated.
- · Seals: NBR
- Springs and Bodies: Stainless Steel.
- Internals: Brass and zinc plated brass.
- Plastic Parts: PA.
- Pressure Range: 100 kPa 1035 kPa (15 psi - 150 psi), (1 BAR - 10 BAR).
 Note: Soft Start = 310 kPa - 1035 kPa (45 psi - 150 psi), (3 BAR - 10 BAR).
- Temperature Range: -7°C to 65°C (20°F 150°F)

Right Angle Flow (RAF) Control

- Eliminates at least one fitting.
- Efficient control of air at source.
- Locks in place once cylinder speed is set.
- Flow from Port 2 to Port 1
- Metered-In or Metered-Out

Precautions, Engineering and Maintenance Symbols

Precautions, Engineering and Maintenance Design

Precautions

Automatic Valve products are general purpose industrial pneumatic and vacuum devices. They are not themselves inherently harmful. However, the control systems in which they operate must have necessary safeguards to prevent injury or damage should failure of system components occur.

Use Automatic Valve products only within the operating specifications stated for the product in each catalog section or on the drawings.

Read and be familiar with the precautions listed under the 'Design", "Installation", "Maintenance" and "Troubleshooting" portions of this section of the catalog or D7179-004. Provide adequate warnings and information on system components and in system operating manuals.

Power Presses: <u>Do not</u> use Automatic Valve Corp's valves for power presses. Automatic Valve does not manufacture the special purpose dual safety clutch and brake valves required by OSHA Regulation 1910.217, dated November 1, 1975, and ANSI Standard B11.1, Revision 1982, and EN 13736: 1999.

Two Position Valves: Two position 2 and 3 way valves will have a flow path from the valve's inlet port to one of the valve's outlet ports in either one or both of the two positions. 4 way valves will always have a flow path from the inlet to one of the outlet ports regardless of its position. If retaining pressurized air in the system presents a hazard during system operation or servicing, a separate method must be used to exhaust the trapped air.

Three Position Valves: Solenoid operated and air piloted three position 3 way and 4 way valves will move to the center position if one of the operators is not actuated. Manually operated three position valves may or may not return to the center position, depending on the centering operator. When one of the operators is actuated, a flow path will exist as it does in two position valves. When the valve is in the center position, the flow path described below exists.

Block Center: All ports, including inlet and exhaust posts, are blocked when the valve is in the center position. If trapping air in either or both of the valve outlet cylinder ports presents a hazard during system operation or servicing, a separate method must be used to exhaust the trapped air or the valve should not be used.

Caution: Valves with blocked centers should be used with discretion because there is no makeup air. Any leaks in the valve, cylinder, or system lines and fittings can cause drifting (movement) of the cylinder.

Exhaust Center: When the valve is in the center position, the inlet port is closed and the cylinder ports are open to exhaust ports. If this condition is hazardous in either operation or during servicing, the valve should not be used.

Pressure Center: When the valve is in the center position, the inlet port pressurizes the cylinder ports and the exhaust ports are blocked. If this condition is hazardous in either operation or during servicing, the valve should not be used.

Solenoid Manual Overrides: Some Automatic Valve air piloted and solenoid operated valves incorporate manual overrides which, when actuated, shift the valve as if the solenoid or air pilot were actuated. If accidental or intentional operation of the manual override could cause a dangerous problem, the valve should be ordered without a manual override.

Precautions, Engineering and Maintenance Design

Valve Sizing Calculations

Find the appropriate valve size for an application by calculating the required C_V (flow coefficient) as shown below and then choose a valve with a C_V equal to or greater than the calculated valve.

The equation is:

$$C_{V} = \frac{Q}{22.67} \times \sqrt{\frac{2 \times G \times T}{(P_{1}^{2} - P_{2}^{2})}}$$

Where: Q = Standard cubic feet of free air (scfm)

G = Gas constant = 1.00 for air

T = Absolute temperature

= Number of $F^{0} + 460$

 P_1 = Valve inlet pressure

= psia (pounds per square inch absolute)

= psig (pounds per square inch gage) + 14.7

P₂ = Valve outlet pressure

= psia (pounds per square inch absolute)

= psig (pounds per square inch gage) + 14.7

Step 1: Determine the cylinder operating speed, S in ft/min.

The equation is: $S = (60 \times L)$ or $(5 \times L)$ $12 \times t$

Where: L = Length of cylinder stroke in inches t = Time to extend or retract in seconds

Step 2: Determine the volume of free air, Q.

The equation is: $Q = \frac{(\prod x D^2)}{576} \times S \times \frac{P_1}{14.7}$

Where: $\Pi = 3.14$

S = Cylinder operating speed
 D = Cylinder diameter in inches
 P1 = Valve inlet pressure, psia

Step 3: Apply Step 1 and 2 results to the C_V formula.

Example: A 2" bore x 2" stroke cylinder is to extend in 0.5 seconds at 80 psig inlet pressure with a 10 psi drop through the valve (70 psig outlet pressure). Assume an operating temperature of 70°F.

Step 1:
$$S = (5 \times L) = (5 \times 2) = 20 \text{ ft/min}$$

Step 2: Q =
$$\frac{(\prod x D^2)}{576}$$
 x S x $\frac{P_1}{14.7}$ = $\frac{(3.14 \times 2^2)}{576}$ x 20 x $\frac{(80 + 14.7)}{14.7}$ = 2.8 scfm

Step 3: Cv =
$$\frac{Q}{22.67}$$
 x $\sqrt{\frac{2 \times G \times T}{(P_1^2 - P_2^2)}}$ = $\frac{2.8}{22.67}$ x $\sqrt{\frac{2 \times 1 \times (70 + 460)}{(80 + 14.7)^2 - (70 + 14.7)^2}}$ = .094

Precautions, Engineering and Maintenance Design

Valve Sizing Chart

The chart below may be used instead of mathematical calculations for close approximations or required valve Cv. The Valve Sizing Chart assumes the following:

- Valve inlet pressure is 80 PSIG.
- Pressure drop through the valve is 10% inlet pressure or 8 PSI.
- There are no line restrictions between the valve and cylinder.
- Distance between the valve and cylinder is 6 feet or less.

Step 1: Calculate the required cylinder speed in inches per second: $S = \frac{L}{t}$

Where: **S** = Cylinder speed in inches per second **L** = Length of cylinder stroke in inches

t = Time to extend or retract in seconds

Step 2: Choose the applicable cylinder bore size column.

Step 3: Move vertically down the column to select a speed (inches per second) equal to or greater than the calculated speed and read the required C_V in the left hand column.

Precautions, Engineering and Maintenance Design

Flow Characteristics

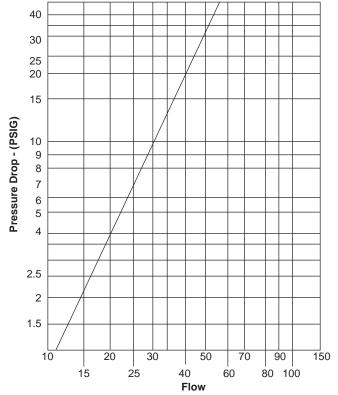

The chart at the right shows the flow (scfm) characteristics for a valve with a C_V of 1.0. Because there is a linear relationship between C_V and flow, a valve with a C_V of 3.0 will have three times the flow at the same pressure drop as does a valve with a C_V of 1.0. This linear relationship many be used to find the required C_V for any flow rate and pressure drop.

Example: Required - Flow of 200 scfm at 80 psig inlet with a 4 psi pressure drop.

Step 1: From the chart at right, a valve with a C_V of 1.0 and a pressure drop of 4 psi, has a flow of 20 scfm.

Step 2: Divide the required flow, 200 scfm, by 20 scfm to determine the required C_V:

 $\frac{200 \text{ scfm}}{20 \text{ scfm}} = 10 \text{ Cv}$

(Standard Cubic Feet per Minute at 80 PSIG Inlet Pressure)

The "SCFM to C_V Approximation" chart at the right is another method for determining C_V . This chart assumes conditions of $70^{\circ}F$ with a 10% pressure drop. "Q" is the standard cubic feet of free air (scfm).

Example: Required - Flow of 200 scfm at 80 psig inlet with a

10% pressure drop and 70°F.

Step 1: From the chart at right, the formula for 80 inlet psig is:

 $C_V = 0.0376 \times Q$ Where: Q = 200 scfm

Step 2: $C_V = 0.0376 \times 200 = 7.52$

An approximation of the C_V with a required flow of 200 scfm at 80 psig inlet with a 10% pressure drop could be obtained from the graph above by determining the numerical value of the 10% pressure drop (80 psig x .10) = 8 psig. This 8 psig pressure drop has a flow of about 26.5 scfm. 200 scfm divided by $26.5 = 7.47 \ \text{CV}$.

SCFM to C_V Approximation @ 70° with a 10% Pressure Drop

Precautions, Engineering and Maintenance Installation

Precautions

Automatic Valve products should only be installed by trained and qualified personnel who have knowledge of how specific pneumatic products are to be piped and electrically connected.

Install Automatic Valve products only in systems which contain adequate safeguards to prevent injury or damage in the event of product failure.

Insure that the system has provisions for turning air and electrical power off and for exhausting all air trapped within the system.

Operating Media

Automatic Valve products are designed primarily for use with air or other inert gases. For use with other media, contact your Automatic Valve distributor.

When solenoid piloted valves are used for vacuum service, an external pilot supply must be used.

Air Lines

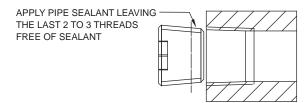

Before installing any pneumatic product, air lines should be blown clean to remove all contamination. Clean air line filters after purging is completed.

Caution: Compressed air streams are dangerous. Divert the stream away from personnel and equipment. Personnel in the area must wear suitable eye and ear protection.

Pipe and Fitting Preparation

Automatic Valve recommends the use of pipe sealant instead of Teflon tape when making connections to NPT ports. The sealant used by Automatic Valve is specified in the bill of material on the drawing.

Pipe sealant should be applied behind the first two or three threads to prevent the sealant from entering and contaminating the system.

While no torque values are available for NPT fittings, a general rule of thumb is to install the fitting hand tight and then turn an additional 1 to $1 \frac{1}{2}$ turns.

Precautions, Engineering and Maintenance Installation

Mounting

Spool valves must be mounted with the spool in a horizontal position. Other valves, cylinders, and accessories may be mounted in any position.

Refer to dimensional data in the catalog or on the drawing.

Where practical, mount valves so that they are accessible for service and so that solenoid manual overrides can be used if applicable.

Valve Inlet Lines

Valve inlet lines should have an inside diameter equal to or greater than the valves' inlet port size as shown in the following chart:

Inlet Tap Size	Supply ID (min.)
1/8 NPT	0.25"
1/4 NPT	0.38"
3/8 NPT	0.50"
1/2 NPT	0.63"

Inlet Tap Size	Supply ID (min.)
3/4 NPT	0.75"
1 NPT	1.00"
1 1/4 NPT	1.25″
1 1/2 NPT	1.50"

Restricted inlet lines will reduce the system operating speed and can cause valve malfunction. Eliminate or minimize sharp bends and install regulators as close as possible to the valve inlet port.

Valve Outlet Lines

For optimum system performance, locate valves as close as possible to the device they are operating. Minimize all sharp bends and other restrictions.

Valve Exhaust Ports

Spool valve exhaust ports may be restricted to provide speed control for cylinders or other devices.

Poppet valve exhaust ports must not be restricted. Such restriction can cause valve malfunction.

All open valve exhaust ports should have mufflers installed to reduce noise levels and to prevent the entry of atmospheric contamination or directed downward with elbows to prevent the entry of atmospheric contamination.

Precautions, Engineering and Maintenance **Installation**

Filtration

Filters with 50 micron elements are adequate for all Automatic Valve products. However, where devices not made by Automatic Valve are used in the system, the manufacturer should be consulted regarding their filtration requirements.

Install filters within 20 feet of the valve or per the manufacturer's instructions.

Operating Pressures and Temperatures

Minimum and maximum operating pressures and temperatures for Automatic Valve products are specified in each catalog section or notes 5 - 8 on the drawing. While products may function at lower or higher limits, such operation is unsafe and must be avoided.

Contact your Automatic Valve distributor if your application requires products that exceed the operating limits shown.

Pilot Pressure

For proper operation, pilot pressure must be within the minimum and maximum operating pressures shown in each catalog section or notes 5 - 8 on the drawing.

If solenoid piloted valves are to operate at lower or higher operating pressures than the specified pilot pressure limits, an external pilot supply within the proper pressure range must be used. Valves may either be ordered with an external pilot supply, option "B", or may be field converted as shown in each catalog section or on the drawing.

Lubrication

Automatic Valve products are pre-lubed at the factory. Components that are pre-lubed are noted with a '+' in each catalog section or in the bill of material on the drawing.

Lubrication of Automatic Valve products is not required but is recommended to maximize service life. Where devices not made by Automatic Valve are used in the system, the manufacturer should be consulted regarding their lubrication requirements.

Lubricators should be installed downstream of regulators, per the manufacturer's instructions.

Oils used in air line lubricators should be compatible with seals used in the system. Generally, Automatic Valve products use Buna "N" seals. Fluoroelastomer seals are available as option "A". Oils should be parafinic, petroleum based with oxidation inhibitors, an ISO 32 or lighter viscosity, and an aniline point between 82°C (180°F) and 99°C (210°F).

In general, lubricators should not be synthetic or reconstituted, and should not have alcohol content or detergent additives.

Precautions, Engineering and Maintenance Maintenance

Precautions

Automatic Valve products should be serviced only by qualified and knowledgeable personnel who understand the function and operation of the product.

Before servicing any pneumatic system, verify that the air and electrical power are off and that all air within the system has been exhausted.

Take all necessary precautions to prevent degradation of products caused by stepping on them, dropping them or hitting them with a hammer or other object.

Return products that are damaged as a result of improper handling to Automatic Valve for inspection.

Preventative Maintenance

Install all pneumatic systems as described in the Installation section. Improper installation can cause sluggish system performance and, if contaminates are not purged, premature wear of components.

Drain, clean, and service air line filters on a periodic basis or as recommended by the manufacturer.

Adjust air line lubricators per the manufacturer's recommendations (generally, one drop per minute) and fill the reservoir at scheduled intervals. When filling the reservoir, use lubricating oils as prescribed under "Installation".

To avoid possible solenoid malfunction, keep all electrical switches and relay contacts in good condition.

Inspect mechanical actuators, such as cams and rollers, for signs of wear and replace when necessary.

Automatic Valve products are designed to operate in normal air system environments with a minimum of maintenance. In extreme conditions, as evidenced by sluggish performance or sticking problems, a periodic program for cleaning internal product components should be established.

To clean products, use a water soluble detergent. To avoid component damage, do not use abrasive compounds or scrape metal parts.

Servicing

When servicing Automatic Valve products, use only those components furnished in Automatic Valve service kits. Items contained in these kits are designated in the service portion of each catalog section or on the drawing.

After a product has been disassembled, discard all items designated as service kit items.

Clean remaining metallic components, except for solenoid coils and housings, with a non-abrasive, water soluble detergent.

When reassembling the product, refer to the appropriate service section or the drawing and lightly lubricate the designated items as per the drawing instructions.

Test the product according to the drawing instructions.

Precautions

Read and follow the precautions listed in the "Maintenance" section of this catalog. Stay clear of all moving parts that must be actuated when troubleshooting.

Troubleshooting Guide

Of all the components in an electrical/mechanical/pneumatic system, it is most often the control valve that will be faulted for system malfunction. In many cases, the valve is only the symptom of the problem. Leaking cylinder seals, poor electrical connectors, clogged air line filters, and broken or jammed mechanical components are just a few of the problems that can initially be diagnosed as a valve problem.

Before disassembling any system component, use the troubleshooting guide to try to pinpoint the exact cause of the problem. The Solutions referenced in the last column are found on the following pages.

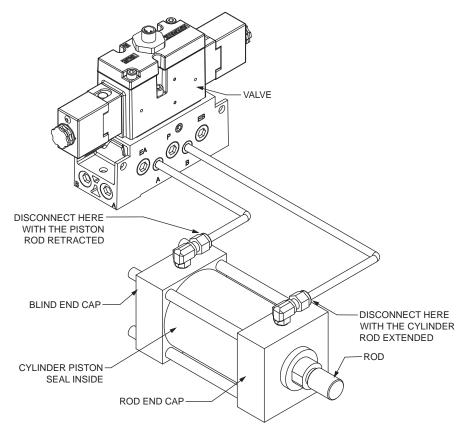

Problem		Possible Cause	Solution	
1	Valve Leaks to Exhaust	Defective cylinder or valve seals	1	
1	when Not Actuated	Maintenance	17	
		Defective cylinder or valve seals	1	
	Nahadaala Edeara	Inadequate air or pilot supply	2 & 3	
2	Valve Leaks to Exhaust when Actuated	Voltage Leak	see Problem 8	
	When Actuated	Contamination	4 & 5	
		Maintenance	17	
3	Solenoid Pilot Leaks	Dirt on seals or seal wear	6	
3	Soleriold Pilot Leaks	Maintenance	17	
1	Operator Vent Leaks	Worn or damaged seal	7	
4	Operator Vent Leaks	Maintenance	17	
		Contamination	4 & 5	
		Inadequate air or pilot supply	2 & 3	
5	Sluggish Operation	Improper or clogged muffler	8	
		Inadequate or improper lubrication	9	
		Mechanical binding	15	
		Maintenance	17	
	Poppet Valve Chatter	Inadequate air or pilot supply	2 & 3	
		Contamination	4 & 5	
6		Improper or clogged muffler	8	
		Inadequate or improper lubrication	9	
		Maintenance	17	
		Incorrect voltage	10	
7	Solenoid Buzzes or Solenoid Burnout	Faulty or dirty solenoid	11	
	Soleriola Burriout	Maintenance	17	
8		Incorrect voltage	10	
	Solenoid Valve Fails to Shift	Override left activated	12	
	Electronically, but Shifts with Manual Override	Defective coil or wiring	13	
	with Handal Override	Maintenance	17	
	Solenoid Valve Fails to Shift Electronically or with	Inadequate air or pilot supply	2 & 3	
		Contamination	4 & 5	
9		Inadequate or improper lubrication	9	
	Shift Electronically or with Manual Override	Mechanical binding	15	
		Maintenance	17	
		Broken spring	14	
10	Valve Shifts but Fails to	Mechanical binding	15	
-	Return	Maintenance	17	
	Cam Operated Valve Fails	Cam or roller adjustment	16	
11	to Operate	Maintenance	17	

Solutions for:

1. Valve Exhaust Port Leakage

Verify if the leakage is caused by the cylinder or valve as follows: (Use extreme caution, as the valve and cylinder will both be actuated during this procedure.)

- 1. With the piston rod retracted, disconnect the line at the cylinder blind end cap. If air comes out of the cylinder port fitting, as shown above, the cylinder piston seals are defective and must be replaced. If there is no leakage, reconnect the line.
- 2. With the cylinder rod extended, disconnect the line at the cylinder rod end cap. If there is leakage at the cylinder port fitting, the cylinder piston seals must be replaced.
- 3. If there is no leakage at the fitting, the leakage is caused by defective valve seals or gaskets. Reconnect the line and install new seals and gaskets available in the valve body service kit.

2. Inadequate Air Supply

An inadequate air supply can cause the pilot supply pressure to drop during valve actuation. This can result in valve chatter or oscillation, particularly in poppet valves, or may keep the valve in a partially shifted condition where it continually blows to exhaust. If the pressure gage falls by more than 10% during valve actuation, there is probably a deficiency in the air supply system.

- 1. Airline filters should be cleaned and pressure regulators checked for proper operation. The line sizing recommendations in the Installation section should be reviewed and modifications made if restrictions or undersize inlet lines are found.
- 2. Verify that the air compressor has sufficient capacity to meet all systems requirements.

Solutions for (continued):

3. Pilot Supply

Remote air pilot signals or pilot supplies to externally piloted solenoid valves that are restricted or are below the minimum operating pressures can cause valve oscillation or partial actuation resulting in exhaust port leakage.

- 1. Verify that the operating signal is at the proper pressure and that there are no restrictions caused by clogged filter elements or improperly sized pilot lines.
- 2. Refer to #2. Inadequate Air Supply for additional troubleshooting suggestions.

4. Liquid Contamination

Accumulation of oil and water at low points in the system, including valves, can cause erratic or sluggish performance and exhaust leaks.

- 1. If heavy concentrations of water or oil are found when a device is disassembled, it should be thoroughly cleaned, re-lubricated and reassembled.
- 2. Filters and lubricators should be cleaned and checked for proper operation. If necessary, air lines should be rerouted to eliminate low points.
- 3. If there are concentrations of moisture at below freezing temperatures, ice can form and cause erratic operations, or completely bind system components. In such situations, steps must be taken to dry the air to a dew point of at least 12°C (10°F) below the minimum system operating temperature. Also, filters should be equipped with automatic drains.

5. Solid Contaminants

Solid contaminants, such as broken pieces of pipe threads, pipe sealant or tape, or rust scale, can cause valve seal damage, scratches on spools and sealing surfaces, or system binding and possible exhaust leaks. Such problems are most often encountered in new installations that have not been properly purged or where there are heavy concentrations of atmospheric contaminants.

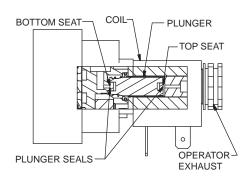

- 1. In many cases, cycling the valve several times will flush the particles away. If not, the item must be disassembled, the parts thoroughly examined for signs of damage and replaced as necessary.
- 2. Before reinstalling the product, the air line should be purged, as stated in the "Installation" section. Air line filters should be cleaned and checked for proper operation. Properly sized mufflers should be installed in valve exhaust ports.
- 3. If there is heavy atmosphere contamination, valves with dustproof option "D" should be installed.

Solutions for (continued):

6. Solenoid Pilot Leakage

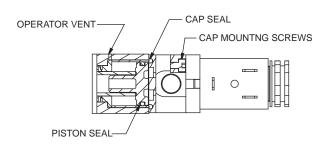

Continuous leakage from the operator exhaust port when the solenoid is de-energized can be caused by a foreign particle trapped between the bottom seat and the plunger, by a damaged bottom seat, or by a worn or damaged bottom plunger seal.

Leakage at the exhaust port and/or solenoid buzzing when the solenoid is energized can result from a foreign particle lodged in the top seat area. Leakage in this area can also be caused by worn or damaged top seats or top plunger seals.

- 1. The solenoid should be disassembled, cleaned, and the parts examined for wear or damage.
- 2. If damaged plunger seals are found, the plunger should be replaced.
- 3. A damaged bottom seat requires replacement of the operator.
- 4. A damaged top seat requires replacement of the solenoid.
- 5. Before reinstalling the product, also follow the recommendations regarding contaminants under Troubleshooting "#5. Solid Contaminants".

7. Operator Vent Leaks

Vent leakage when the solenoid is energized can be caused by either a faulty operator piston or cap seal, by an improperly placed cap seal, or by improperly tightened cap mounting screws.

Vent leakage when the solenoid is de-energized is often caused by an improperly placed cap seal or by improperly tightened cap mounting screws.

- 1. In either case, tighten the cap mounting screws before disassembling the operator to determine if this will stop the problem.
- 2. If tightening the screws does not work, disassemble the operator, clean it, replace worn or damaged seals, and reassemble taking care to properly position the cap seal.

Solutions for (continued):

8. Mufflers

Mufflers that are undersized for the application or that have become clogged can cause slow system response or, in the case of poppet valves, system malfunction of valve oscillation.

- 1. Remove the muffler and cycle the valve several times to see if it operates satisfactorily without the muffler.
- 2. If it does, the muffler should be cleaned or, if it is not dirty, replaced with a larger muffler with adequate exhaust flow capacity.

9. Improper Lubrication

Air line lubricators that are not set at the proper flow rate or that contain lubricants not compatible with seals can cause sluggish system performance or malfunction.

- 1. If oil mist can be seen in the exhaust air, if films of oil are in evidence on surfaces around exhaust ports, or if pools of oil are found in valves or other devices, the lubricator is set at too high a flow rate. As a general rule, a flow rate of one drop per minute is adequate to provide a thin film of oil on moving surfaces.
- 2. If the flow rate is too low or the reservoir is empty, system elements that require lubrication can slow down or even bind. Lubricator reservoirs should be filled on a scheduled basis and the proper lubricator flow rate maintained.
- 3. Compatibility of the lubricating oil with system seals should also be verified, as stated in the Installation section. Incompatible lubricants can cause seals to swell which can result in sluggish performance or even binding of moving parts.

10. Incorrect Solenoid Voltage

Automatic Valve solenoids are designed to operate at between 90% to 110% of the rated voltage shown on the solenoid coil. A supply voltage that does not fall within the range shown can cause solenoid buzzing, failure of the valve to shift, or coil burnout.

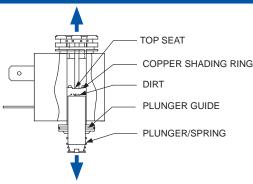

- 1. To verify proper voltage, shut off and exhaust the air supply to the valve.
- Attach a voltmeter to the solenoid's electrical supply, energize the solenoid, and note the voltage reading. If the reading is too low, the electrical supply is inadequate and must be corrected.

Solutions for (continued):

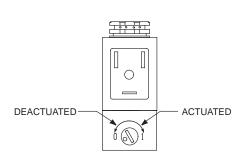

11. Faulty or Dirty Solenoid

Improper voltage, broken or damaged shading rings, or dirt on the plunger or around the top seat can cause solenoid buzzing or even coil burnout.

- 1. The electrical supply should be shut off and the pilot section disassembled for inspection. Verify correct voltage (See Troubleshooting #10. Incorrect Solenoid Voltage).
- 2. If the copper shading ring around the top seat is cracked or damaged, the solenoid assembly should be replaced.
- 3. If dirt is found in the plunger guide and on the plunger/spring, they should be thoroughly cleaned and inspected for damage. If no damage is found the solenoid assembly can be reassembled. If damage is present, the solenoid assembly should be replaced.

12. Manual Override Left Activated

For W and X Solenoids

If a turn-locking manual override is left in the activated position, the valve will operate when the override is again cycled, from on to off and back to on, but will fail to operate electrically. This happens because the override is holding the plunger in its activated position.

1. Verify that locking type overrides are in their normal deactived position and that non-locking overrides have not become stuck.

Shown: Direct Acting Solenoid (K02 Series)

13. Defective Coil or Wiring

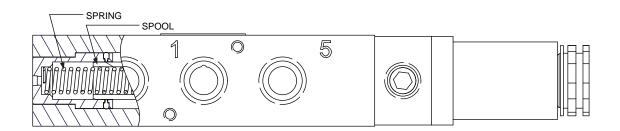

Coils used by Automatic Valve seldom burn out when operated within listed voltage limits.

- 1. Verify that the operating voltage is correct. Refer to Troubleshooting #10. Incorrect Solenoid Voltage.
- 2. Verify that there is no dirt in the plunger. Refer to Troubleshooting #13. Faulty or Dirty Solenoid
- 3. Verify that washdown applications have not caused thermal shock.
- 4. Verify the integrity of the coil by shutting electrical power off and using an ohmmeter to check continuity. If the coil is open, it is burned out and must be replaced. If there is coil continuity, the electrical system should be checked for loose or broken connections and for worn or defective switches and contacts.
- 5. If cam operated switches are part of the electrical system, check for worn or loose cams.

Solutions for (continued):

14. Broken Spring

Broken springs on spring return valves can cause a valve to remain in the actuated position or to only partially return and perhaps leak to exhaust.

1. Broken springs must be replaced and are included in service kits.

15. Mechanical Binding

Mechanical binding of cylinders or other mechanical components can cause symptoms that can be improperly diagnosed as sluggish valve operation or even failure of a valve to shift. If a valve appears stuck, note the flow from the valve exhaust ports as the valve is actuated and deactuated. If there is a puff of air from each exhaust port, yet the device fails to move, the probable cause is mechanical binding.

- 1. Turn air and electrical power off.
- 2. Follow all safety precautions recommended by the manufacturer of the equipment.
- 3. Make mechanical inspections and adjustments as required.

16. Cam or Roller Adjustment

When cam activated valves fail to activate, check cams and rollers for proper alignment or wear.

- 1. Make any required adjustments.
- 2. Replace worn cams and rollers.

17. Maintenance

- 1. When disassembling, carefully place parts in same order of removal, reverse order of the drawing bill of material.
- 2. Refer to the Installation and Maintenance section.
- 3. Reassemble parts in reverse order of disassembly, in order of the drawing bill of material.

Precautions, Engineering and Maintenance Glossary

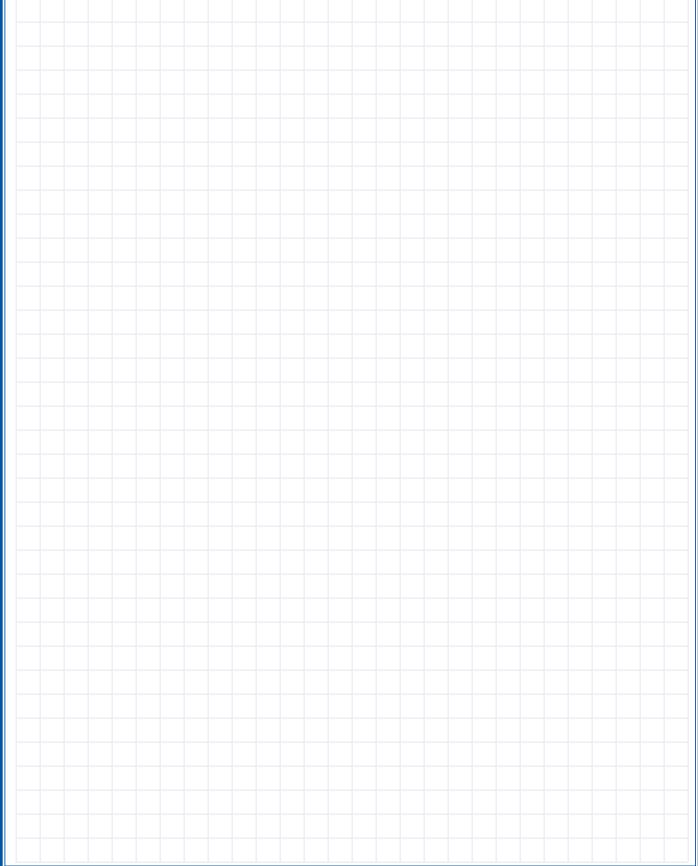

Ambient Temperature	The temperature of the immediate environment.
ATEX	European Community directive concerning equipment and protective systems intended for use in potentially explosive atmospheres.
CE	Conformite Europienne - Certification of a product to indicate that the product satisfies all the regulations governing safety laid down by the European Community. Products displaying this mark can be freely distributed within the markets of the European Community. Consult the factory for information on products certified by CE.
Celsius, Degree	A unit of temperature measurement abbreviated °C. Celsius temps are calculated from Fahrenheit temps by the following formula: $C = \frac{5(F-32)}{9}$
CSA	Canadian Standards Association - Provides certification services for manufacturers who, under license from CSA, wish to use the appropriate CSA marks on certain products of their manufacturer to indicate conformity with CSA standards. Consult the Factory for information on products conforming to CSA standards.
C _v	Measure of calculating flow of a valve (or other pneumatic device) that takes into effect the temperature, pressure, pressure drop, and flow.
Detent	A devise for retaining movable parts in one or more fixed positions; usually a spring- loaded device fitting into a depression. Positions of parts are changed by exerting sufficient force to overcome the detent spring, or by releasing the detent.
DIN 43650/DIN 43650C	International standard for 3-pin connectors.
Fahrenheit, Degree	A unit of temperature measurement abbreviated °F. Fahrenheit temps are calculated from Celsius temps by the following formula: $F = \frac{9C}{5} + 32$
Fluid	A liquid or a gas.
FM	Factory Mutual Insurance Company partnership recognized as a Nationally Recognized Testing Laboratory(NRTL) under 29 CFR 1910.7
kPa	Kilopascals - International measure of pressure. 145 psig = 1000 kPa.
Media	The fluids used in a fluid power system. In a pneumatic system they are gases such as air, nitrogen or various inert gases.
Media Temperature	The temperature of the fluid within a valve or other device
NEMA 4	National standard for enclosure protection. Provides protection against dirt, dust, water hosedown and rain.
NEMA 7	National standard for enclosure protection.
Pressure Range	The range of inlet pressures with which a device can operate satisfactorily.
psi	Pressure - pounds per square inch - A measure of force per unit area.
psia	Absolute Pressure - pounds per square inch absolute - The sum of atmospheric pressure and gauge pressure.
psig	Gauge Pressure - pounds per square inch gauge - Pressure above or below atmospheric pressure.
РТВ	Physikalisch Technische Bundesanstalt - The National Institute of Natural and Engineering Sciences and the highest technical authority for metrology and physical safety engineering of the Federal Republic of Germany.
scfm	Flow Rate - standard cubic feet per minute - The volume or weight of fluid passing through a conductor per unit of time.
Signal	A fluid or electric command to the valve actuator causing valve to change position.
Standard Air	Air at a temperature of 68°F, a pressure of 14.69 pounds per square inch absolute (psia), and a relative humidity of 36 percent (0.0750 pounds per cubic foot). In gas industries the temperature of standard air is usually specified as 60°F.
Vacuum	Pressure less than atmospheric pressure.

Precautions, Engineering and Maintenance Notes

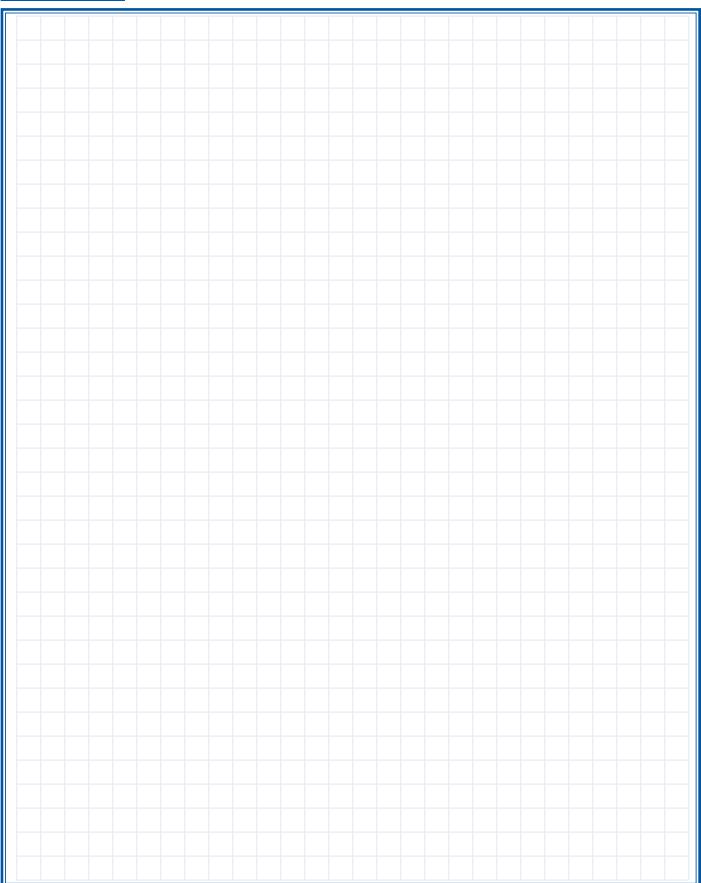

Precautions, Engineering and Maintenance

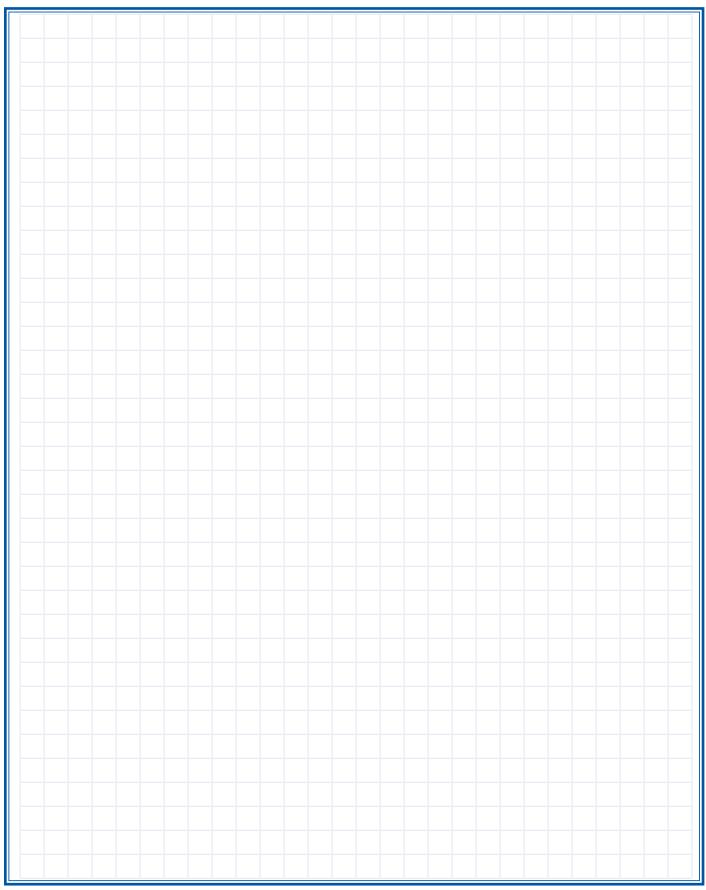

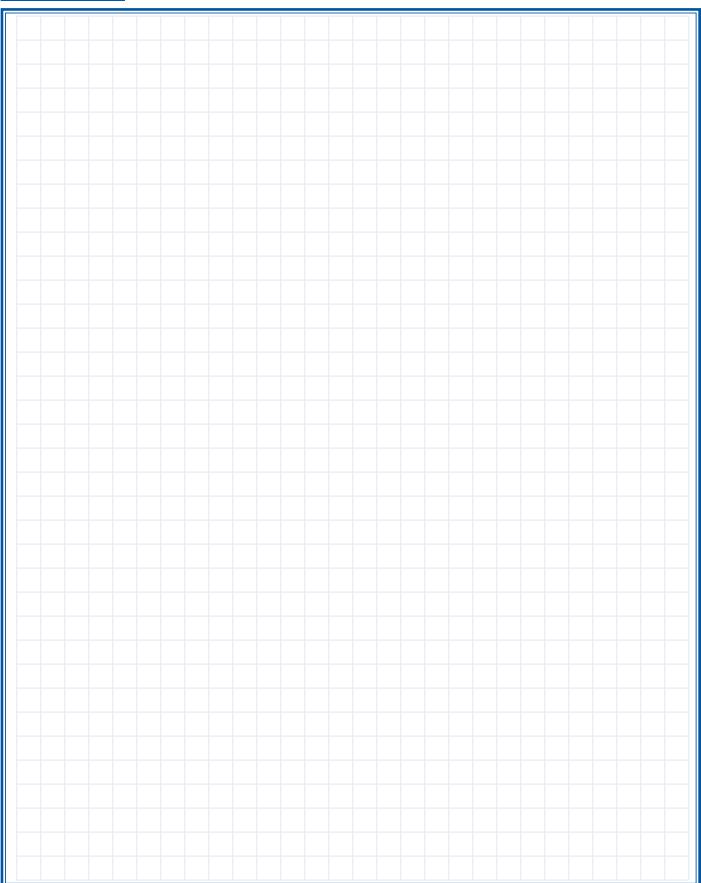

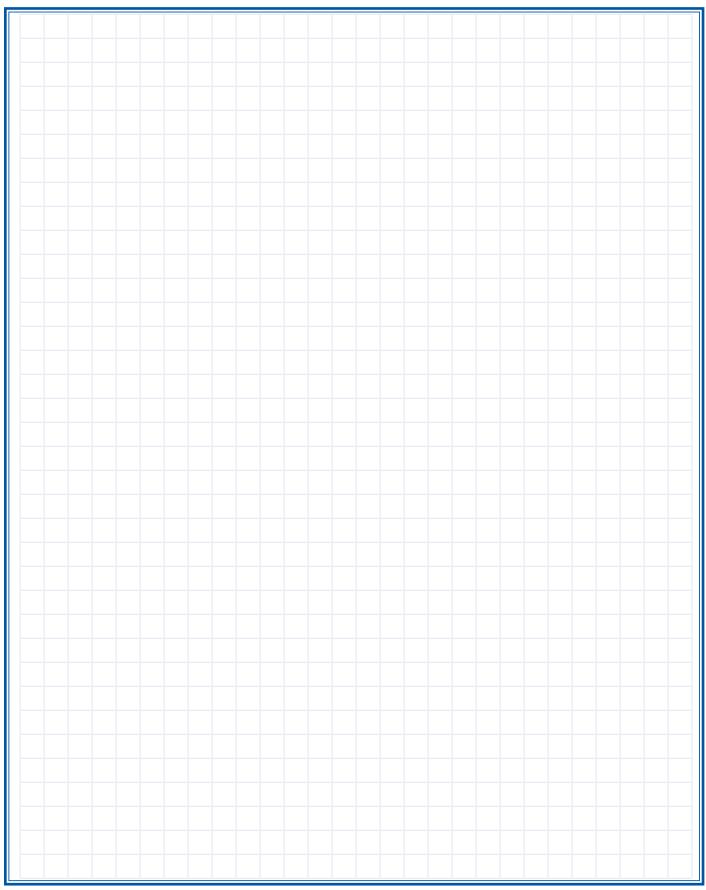

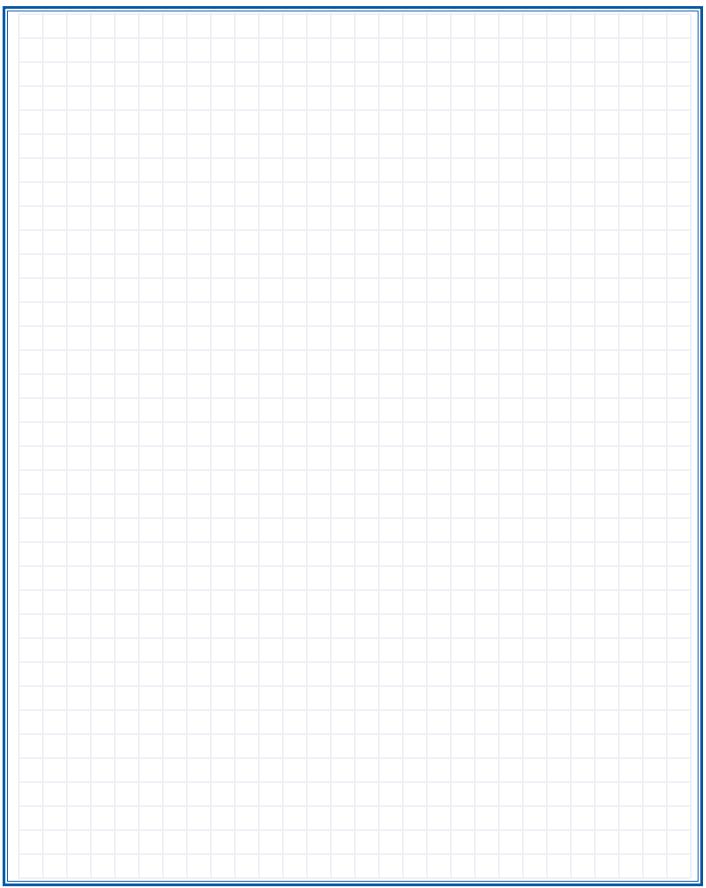

Warranty

Automatic Valve warrants its products to be free from defect in material or workmanship over a period of 18 months from the date of shipment from its factory. Automatic Valve will, at its option, either repair or replace the non-conforming product at no charge upon return of the product with transportation prepaid.

Automatic Valve will replace standard commercial grade NEMA 4 solenoid coils which fail due to burnout when operated within their rated capacity or voltage.

Automatic Valve is not responsible for damage to its products through improper installation, maintenance, use, repairs or operating beyond rated capacity of voltage, intentional or otherwise. Automatic Valve is not liable for claims for labor, loss of profit or good will, repairs, delay damages, direct or indirect penalties, or expenses incidental to replacement. The buyer, by acceptance of delivery, assumes all liability for the product's use or misuse in the as-shipped condition.

Automatic Valve, recognizing its goal of continuous improvement, reserves the right to discontinue or change specifications, products or prices without incurring obligation.

Precautions

Applications: Automatic Valve manufactures general purpose, industrial pneumatic and vacuum service valves, which are not inherently harmful. However, the control systems in which they operate must have safeguards to prevent injury or damage in case of system component failure.

OSHA 1910.217, dated November 1, 1975, ANSI B11.1, Revision 1982, and EN 13736: 1999 specifically recommend special purpose dual (double) safety clutch and brake valves for power presses. Automatic Valve does not manufacture special purpose dual safety valves for presses. Do not use Automatic Valve Corp's valves for power presses.

Two position valves, whether they are 2 way, 3 way, or 4 way, will always have a flow path from the valve's inlet port or ports to one of the outlets, regardless of which of the two positions is used. If air trapped in or exhausted from the ports presents a hazard in operation or in servicing the system, a separate method must be provided to exhaust this air or the valve should not be used.

Three position 3 way and 4 way valves, whether solenoid operated, air piloted or manually operated, can move to the center position if the operators are not actuated. If air trapped in or exhausted from the ports presents a hazard in operation or in servicing the system, a separate method must be provided to exhaust this air or the valve should not be used.

Some solenoid and air piloted valves incorporate manual overrides. Manual overrides, when activated, shift the valve as if the solenoid or air pilot were actuated. If accidental or intentional operation of the manual override could cause a dangerous problem, valves without a manual override should be used.

Use valves only within specification limits listed in our catalog.

Installation: Consult the Engineering and Maintenance section of the Automatic Valve catalog #0001-001 for installation instructions. Do not install valves without first turning off air and electricity. Valves must be installed by qualified and knowledgeable personnel who understand how specific valves are to be piped and electrically connected. Do not install valves unless the valves' flow path, as described by ANSI and ISO symbols in our catalog, conform to the application's design specifications.

Maintenance: Disconnect air and electricity and bleed all pressurized lines before removing two and three position valves. Consult the Engineering and Maintenance section of the Automatic Valve catalog #0001-001 for maintenance instructions. Servicing should only be undertaken by qualified and knowledgeable personnel who understand the function and operation of specific valves. Care must be followed to prevent damage to valves caused by stepping on them, dropping them or hitting them with any object. Damaged valves should be returned to Automatic Valve for inspection and rebuilding.
